# 8-Bit CONSTANT CURRENT LED DRIVERS

### ST2221A

# **8-Bit CONSTANT CURRENT LED DRIVERS**

### **General Description**

The ST2221A is specifically designed for LED and LED DISPLAY constant current drivers. The value of constant current can be varied using an external resistor ( $I_{out} = 5 \sim 90 \text{mA}$ ). The devices include an 8-bit shift registers, latches, and constant current drivers on a single Silicon CMOS chip.

#### **Features**

• Constant Current Output: Current with one resistor for 5mA to 90mA

• Maximum Clock Frequency : 25MHz (Cascade Operation)

• 5V CMOS Compatible Input

• Package: PDIP16,SOP16,SSOP16

• Constant Current Matching:  $(Ta = 25^{\circ}C \cdot VDD = 5.0V)$ 

Bit-to-Bit :  $\pm$  6% \ Chip-to-Chip :  $\pm$  10% \

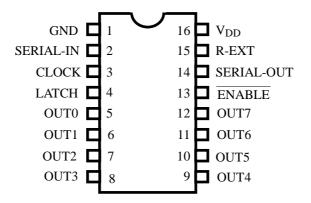

@  $Iout = 5 \sim 40 \text{mA}$ 

Bit-to-Bit :  $\pm$  6% \ Chip-to-Chip :  $\pm$  10% \

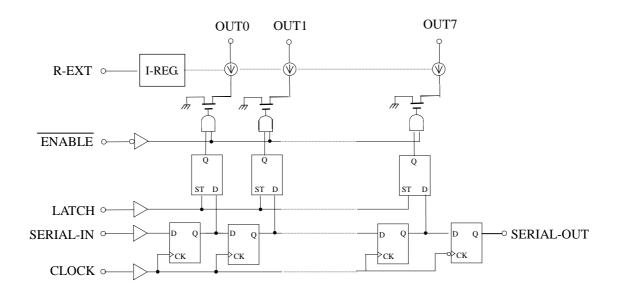

@  $Iout = 40 \sim 90mA$ 

### Pin Connection (Top view)

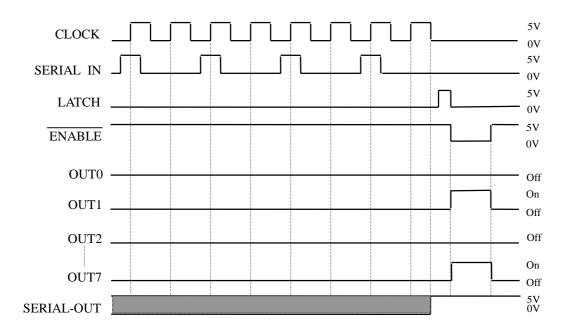

# **Block Diagram**

### **Timing Diagram**

(Note) Latches are level sensitive (not edge triggered).

LATCH-terminal = H level, latches become transparent; LATCH-terminal = L level, latches hold data.

ENABLE-terminal = H level, all outputs (OUT0~7) are off.

An external resistor is connected between R-EXT and GND for setting up the value of constant current.

SERIAL-OUT changes state on the falling edges of clock.

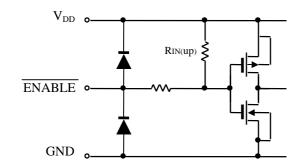

# **Pin Description**

PIN No.	PIN NAME	FUNCTION
1	GND	GND terminal
2	SERIAL-IN	Input terminal of a data shift register
3	CLOCK	Input terminal of a clock for shift register
4	LATCH	Input terminal for data strobe
5~12	OUT0~7	Output terminals
13	ENABLE	Input terminal for output enable (active low)
14	SERIAL-OUT	Output terminal of a data shift register
15	R-EXT	Input terminal of an external resistor
16	$V_{ m DD}$	5V Supply voltage terminal

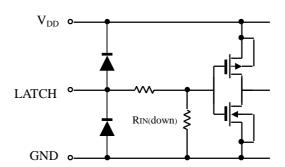

# **Equivalent Circuit of Inputs and Outputs**

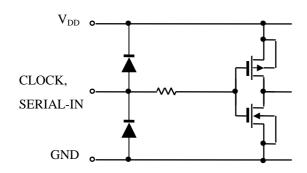

### 1. ENABLE terminal

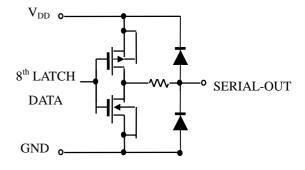

#### 2. LATCH terminal

#### 3. CLOCK, SERIAL-IN terminal

#### 4. SERIAL-OUT terminal

### **Maximum Ratings** (Ta=25°C, Tj(max) = 140°C)

CHARACTERISTIC	SYMBOL	RATING	UNIT
Supply Voltage	Vdd	0 ~ 7.0	V
Input Voltage	VIN	-0.4 ~ VDD+0.4	V
Output Current	Iout	90	mA
Output Voltage	Vout	-0.5 ~ 9.5	V
Clock Frequency	fCLK	25	MHz
GND Terminal Current	IGND	720	mA
		1.12 ( PDIP-16 : Ta=25°C)

#### 2. CLOCK-LATCH

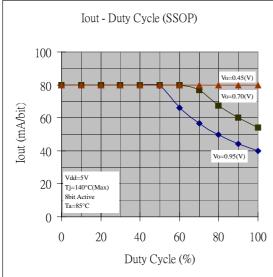

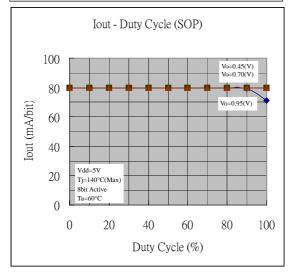

### 3. ENABLE-OUTn

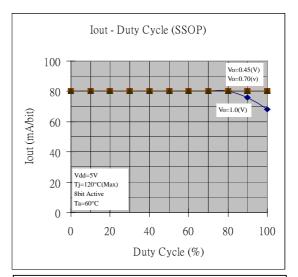

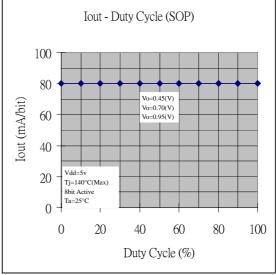

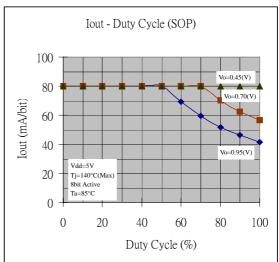

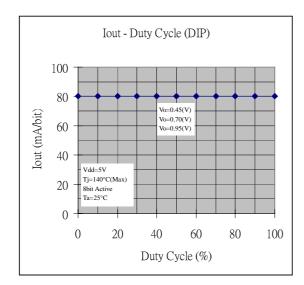

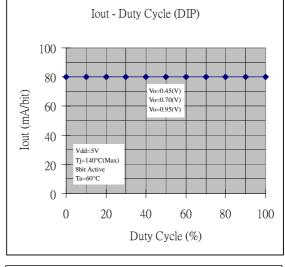

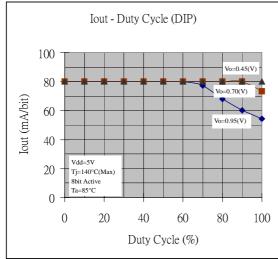

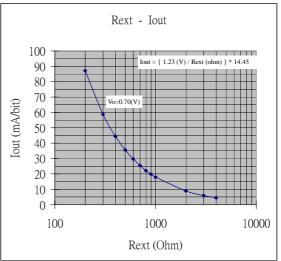

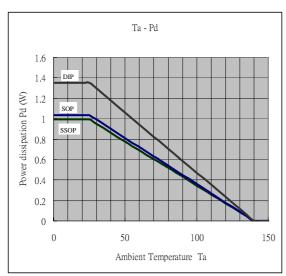

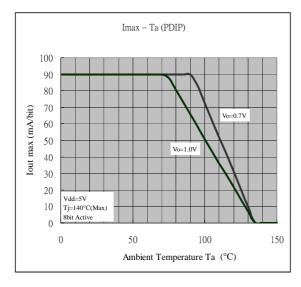

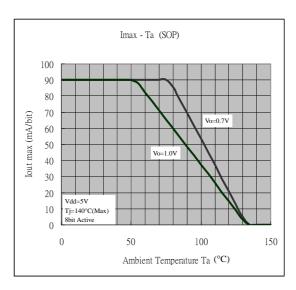

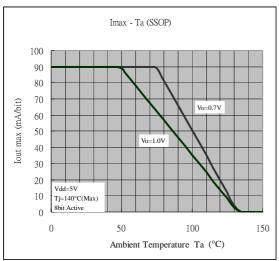

#### Note

As the power dissipation of a semiconductor chip is limited its package and ambient temperature, this device requires a maximum output current be calculated for a given operating condition. The maximum allowable power consumption (Pd (max)) of this device is calculated as follows:

$$Pd(\max)(Watt) = \frac{(\text{Tj (junction temperature) (max)} - \text{Ta (ambient temperature) )(}^{\circ}C)}{\text{Rth (}^{\circ}C/Watt)}$$

Based on the Pd (max), the maximum allowable current can be calculated as follows:

$$Iout = (Pd - V_{DD} \cdot I_{DD}) / (\# outputs \cdot Vo \cdot Duty)$$

### **System Configuration Example**

[1] Output current (I<sub>OUT</sub>)

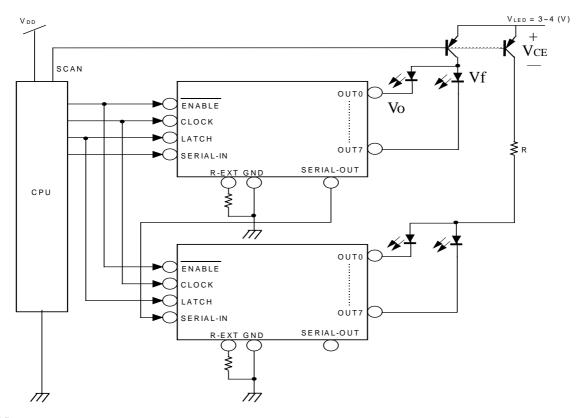

Sink current is set by the external resistor as shown in figure (Iout vs. Rext).

[2] LED supply voltage (V<sub>LED</sub>) setup

$$V_{LED} = V_{CE} (T_r V_{sat}) + V_f (LED \text{ forward voltage}) + V_O (IC \text{ supply voltage})$$

To prevent too much power dissipated by the device due to higher  $V_{LED}$ , an additional R can be used to reduce the Vout when the outputs consume current:

$$R = \frac{V_{LED} - V_f - V_O(\min)}{I_O(\max) \bullet Bit(\max)}$$

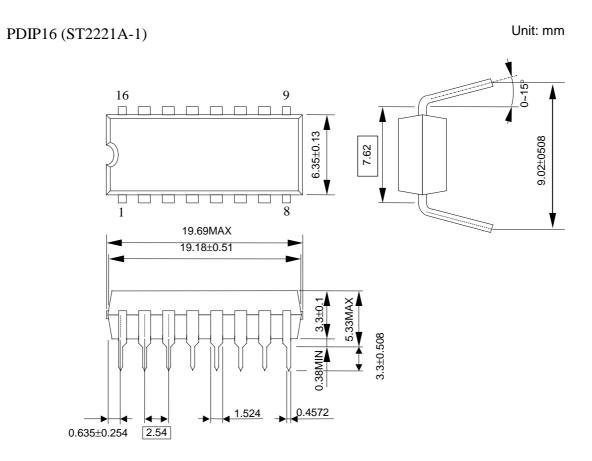

Note

This device has only one ground pin shared by signal, output sink current, and power ground. It is advisable to pattern the ground layout with minimized inductance such that the switching noise induced by the input signals and the output sink current would not cause chip malfunction. To prevent the drivers' outputs from damage by overshoot stress, it is also advisable not to turn off the drivers and scan transistors simultaneously.
